

TOMOE TRITEC

THE ULTIMATE PROCESS VALVE

150 / 300 / 600 / 900 / 1500 / 2500LB RANGE

TOMOE TRITEC LTD.

Single Offset

The centre of rotation is moved back from the centreline of the valve disc. The seat and seal are designed conically and on centre. This design relies on a frictional, interference seal and so is applicable only to soft seated valves.

Double Offset

The centre of rotation is moved from the centerline of the valve body. The seat and seal design remains conical and on centre. This design again relies on a frictional, interference seal, but the length of rotation over which this friction occurs is reduced, allowing a larger range of process resistant seat materials to be used. However these materials must be relatively soft or highly elastic to prevent “jamming”.

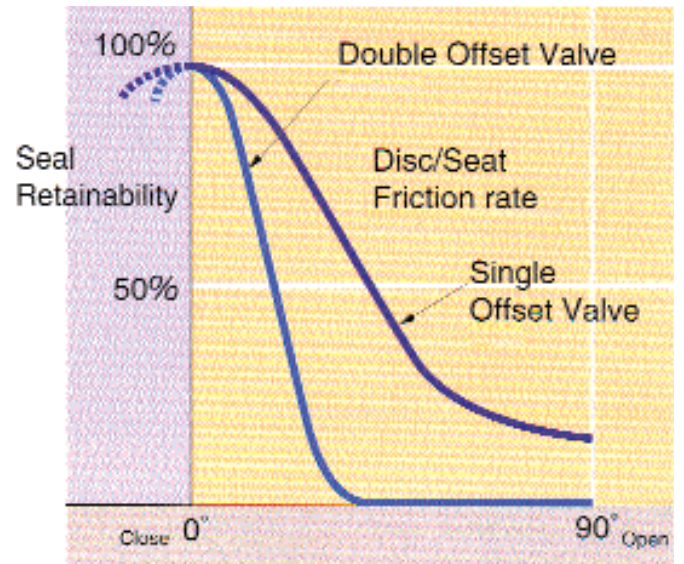

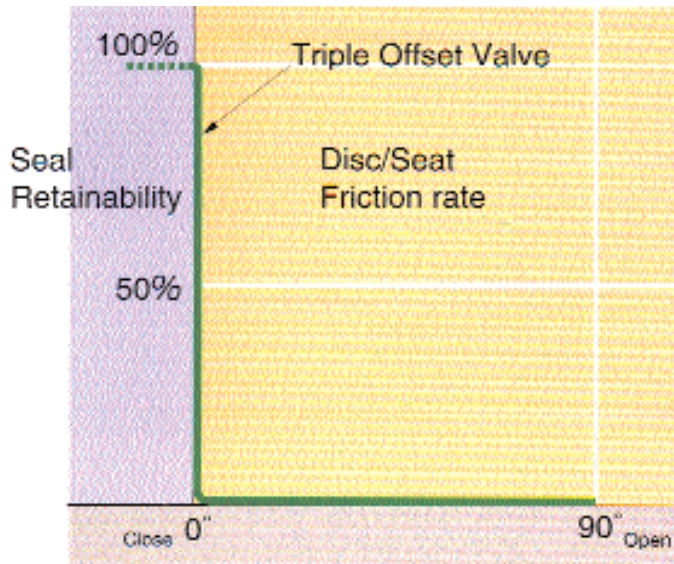

Triple Offset

The centreline of the cone is rotated away from the valve centreline resulting in an ellipsoidal profile and providing the third offset. With this geometry, seat seal interference is completely eliminated ensuring long sealing life. The result is a torque seated, process pressure aided FRICTIONLESS seal. The geometry allows the body seat to be used as the closed limit stop, aiding operator adjustment. The Triple Offset design is ideally suited to metal seated valves providing bubble-tight performance on high temperature, high pressure and firesafe applications.

Offset Valve-Disc/Seat Friction

Features of the Tritec Valve

- Triple offset and ellipsoidal sealing geometry
- Bi-directional zero leakage
- Inherently Firesafe
- Developed Geometry results in
 - Zero Seat/Seal Friction
 - Low Torques
 - Extended Service Life
 - Continued Seal through Thermal Cycling
 - Torque Seating

- Excellent flow and throttling characteristics covering services from Cryogenic to high temperature
 - Excellent control of Fugitive Emission by virtue of Rotary stem movement and advanced packing materials
 - Less than 10ppm on Fugitive Emission Test to cover EPA21
- Other tests available on request*

- Firesafe to BS6755 part 2 / API 6FA and API Std 607 4th Edition

- Available Fully Rated to Class 1500Lb

- Fully rated for end of line duty

- Standard materials conform to NACE, all exotic materials also available.

- Laminated seat is mounted in the body, removing it from the erosive effects of the flowing media

- Seat is self centering "floating" design

- Both Seat and Seal are field replaceable without special tools.

- Unique elliptical bolting pattern allows foolproof replacement of seat and seal

- Gasket Sealing Face is completely uninterrupted by fixings

- Suitable for use with Spiral Wound gaskets and all flange finishes including RTJ

- Antiblowout device on shaft with both internal and external retaining systems according to API Std 609

- ISO mounting flange allows easy fitting and changing of operators

- Operator is bolted and doweled to prevent radial movement and subsequent loss of seating torque.

- Body counterbore and seat bolting arranged elliptically to ensure equal support, gasket land and gasket loading all around the elliptical edge of the laminated body seat.

- Inboard AND outboard thrust mechanisms prevent decentralising of disc, even under high temperature and line pressure.

- By eliminating seat-seal friction on unseating, Tritec removes the "Blind Zone" and increases the rangeability or controllable range to the full 90° of movement. The rotation geometry and inboard bearing design reduce the effect of dynamic torque and mechanical noise-vibration, increasing midrange control accuracy. Cavitation and Noise reducers are available to complement the Tritec valve under high pressure drop process situations.

■ **CRYSEAL - CRYOGENIC VALVES.** Temperatures to - 196°C. Designed, tested and certified to BS6364 1988.

■ **DOUBLE BLOCK & BLEED VALVES.** To allow verifiable, maintainable shut-off in critical isolation applications. Firetested to BS 6755 part 2/API6FA & API607 4th edition.

■ **STEAM JACKETED VALVES.** To maintain process temperatures ensuring media remains fluid. Disc and shaft steam tracing as an option.

■ **TOP ENTRY VALVES**
Allowing complete maintainability on valves which are welded into line. Available on standard and cryogenic ranges.

■ **CONTROL VALVES.** Frictionless seating means increased rangeability, allowing the Tritec valve to perform in both control and isolation application

■ **VALVES TO REDUCE FUGITIVE EMISSION.** Designed to reduce fugitive emission, testing is available to all international standards plus customer specific requirements.

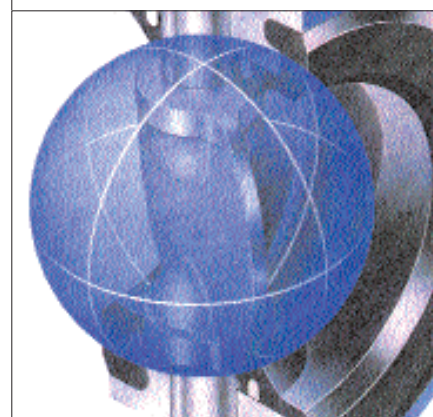

■ **COMMISSIONING SETS**
Allowing process flow rates to be set accurately via manually operated valves.

■ **TADPOLE RUBBER SEALED VALVES.** Resilient sealed, double offset valves available in ratings to 300LB, in all materials and with various seal rubbers. eg Nitrile, Viton, EPDM, Silicon, Butyl etc

■ **RUBBER SEALED VALVES.** Extending the range of materials available in the Tomoe Rubber seated valve range.

Standard Specifications

Design	API Std 609, BS 5155, ANSI B16.34, ASME SEC VIII
Valve Sizes	2"(50mm) - 48"(1200mm)
Pressure Classes	Class 150Lb - Class 1500Lb
Body Styles	Lugged, Wafer Flangeless, Double Flanged, Butt Weld End
Flange Accommodation	ANSI B16.5: 2" - 24" ANSI B16.47 Series A&B : 26" - 48"
Face to Face Dimensions	LUG and WAFER Type API Std 609 Table 2 : 3" - 24" API Std 609 Table 1 : 30", 36", 42", 48" SO 5752 Wafer Short : 28", 32", 40" DOUBLE FLANGED Type ISO 5752/BS 5155 Double Flange Short
Pressure Temperature Ratings	ASME/ANSI B16.34 : for Steel ASME/ANSI B16.24 : for Bronze Working Temperature Range as Standard -29°C (-20°F) to +538°C (1000°F) With selection of suitable materials -100°C (-148°F) to +700°C (1292°F)
Pressure Tests	Shell Test, Seat Test API Std 598 Seat Leakage Rate API Std 598, ISO 5208 Rate A, ANSI B16.104 (ANSI / FCI 70-2) Class VI
Firesafe	Certified Firesafe to BS 6755 Part2/API 6FA and API 607 4th Ed.
Marking	API Std 609 MSS SP-25
Operators	Manual, Electric, Pneumatic, Hydraulic

- * 1. Please contact the sales office for larger sizes.
- * 2. Please contact the sales office for pressure classes above 1500Lb.
- * 3. JIS 10K, 20K, 30K MSS, API, BS, DIN, PN, ISO also available on request.
- * 4. ISO 5752 Gate Valve Short (Basic series 3/ASME B16.10) on request.
- * 5. For Cryogenic range (temperature to -196°C (-320°F)), please contact the sales office.

ITEM	DESCRIPTION	STANDARD General hydrocarbon duties including Sour Gas, Flare Gas, Steam and Process Gases.	OPTION 1 Low temperature hydrocarbons (down to -100°C), Condensates Blowdown Gas and other general corrosive duties.
1	Body	Cast carbon steel ASTM A216 WCB or Plate carbon steel ASTM A516 Gr.70 or BS EN10025 S275JR	Cast Stainless steel ASTM A351 CF8M

- Contact the sales office for torque figures not shown above.
- Torques shown are for full rating and are linear with pressure. Do not use less than the minimum sizing DP when calculating operating torques.
- Tomoe Tritec suggests a minimum of 20% Safety Factor on the above torques.
- Although the valves are suitable for Bi-Directional use, the offset geometry creates a Preferred direction of flow which if used (for uni-directional flow) can show a torque and actuator size reduction.
- Maximum shaft torque is for 17-4PH in the H1150+1150 condition. For other shaft materials, consult Tomoe Tritec for guidance.
- Run torques are 40% of the Preferred direction Opening torque.
- Torques shown are valid for temperatures of -100°C (-148°F) to +538°C (+1000°F) For temperatures outside this range consult Tomoe Tritec.
- Torques shown assume a maximum liquid velocity (pipeline) of 5 m/s. For higher liquid velocity, where hydrodynamic torque may need to be considered, consult Tomoe Tritec.
- Please ensure that any actuator chosen to operate the Tritec valve is capable of supplying 5° over-travel and has mechanical limit stops controlling the closed position.
- Note that operators must be dowelled to the valve mounting plate. Dowels will be supplied with bareshaft valves but it is the purchasers responsibility to ensure separately purchased operators and mounting kits are machined to accommodate these dowels.
- If in doubt, contact the sales office.

Gate Valve Face to Face

For the direct replacement of gate valves, all dimensions are exactly as per the standard Double Flanged valve with the exception of the face to face dimension which is shown below.
(in accordance with ISO 5752 gate valve short).

Valve size		150LB	300LB	600LB	900LB	1500LB

600	24	508	1143	1397	1549	1943

Allows direct replacement of existing gate valves without modification of pipework.

Disc remains within the body face to face in the fully open position to allow removal of the valve from pipework even when the valve is open.

Reduction of fugitive emission due to quarter turn rather than linear shaft movement.

Reduced operator costs due to quarter turn rather than multi turn / linear.

INTRODUCTION

This instruction provides general information on the operation, installation and maintenance of the Tritec triple offset valve. The Tritec valves have been designed and manufactured to operate in an aggressive environment under extremes of temperature and pressure for long periods and with minimal maintenance.

INSTRUCTIONS

PACKING

1. All valves will be despatched with protective covers attached to the flange faces to protect the gasket sealing surfaces and internal trim.
2. The valve disc is cracked off the seat in the almost closed position.
3. The Tritec nameplate shown in the picture contains information such as size, pressure class, materials and the unique serial number.

SPARE PARTS

1. When ordering spare parts or discussing matters concerning this valve with the sales office, it is essential to quote the unique Serial Number of the valve which is to be found on the stainless steel nameplate attached to the valve body adjacent to the operator.

TRANSPORTATION

1. Use crates or packing cases for ocean transportation.
2. For overland transportation, a covered vehicle is recommended with protective sheets covering the valves.

STORAGE

1. Store the valves indoors in a cool temperature between -10°C and $+60^{\circ}\text{C}$, humidity at 70% or less.
2. Do not remove the protective covers until ready to install valves.
3. Machined ferrous surfaces are protected with an approved rust preventative. For long periods of storage, apply the rust preventative once a year to the unpainted surfaces.
4. When storing valves unpacked, take care in protecting valves and actuators from excessive loads. Do not stack unpacked valves.
5. If the valve is for clean gas duty and is being supplied "DEGREASED", a label is attached stating this and the valve sealed in a polythene covering. It is suggested that the valve is kept packed until it is to be installed in the pipeline.

UNPACKING

1. Unpack valves just before installation.

INSTALLATION

- Ⓐ The valve is designed to seal against bidirectional flow and can therefore be installed with flow in either direction. However enhanced sealing life will be obtained with upstream flow against the shaft side of the disc. This preferred flow direction is shown on the nameplate attached to the valve body adjacent to the operator and also on the GA drawing. The valve may be installed in the pipeline with the valve shaft in a horizontal, vertical or intermediate position.
- Ⓑ Prior to installation, the pipeline must be cleaned from dirt and welding residues to avoid damage to the valve during operation.
- Ⓒ Ensure that the valve is closed prior to installation to avoid the risk of damage to the sealing surfaces.

- Ⓓ The valve must be lifted by the eyebolt or lifting eyes provided with the valve.
- Ⓔ The valve must not be lifted by the operator or handwheel.
- Ⓕ The valve must not be used for pipework alignment.
- Ⓖ The Lugged or Double flanged type valve is suitable for dead end service ie.end of line duty, in either direction (in case of the valve specified both directions) to the full rating pressure of the piping system.

MAINTENANCE

Tomoe Tritec triple offset valves are designed for minimum maintenance, however, it is recommended that the valve is cycled several times from fully open to fully closed every 3 months. In addition it is recommended that the valve is removed from the pipeline every two years and is subjected to a thorough visual inspection particularly in the sealing areas for signs of damage or wear.

To carry out maintenance as detailed below, no special tools are required but it should be noted that a torque wrench covering the torque range required will be needed. Before carrying out any of the maintenance detailed below, please ensure that a copy of the relevant GA drawing is available to facilitate identification and location of the component parts.

Adjustment / Replacement of Gland Packing

The Tomoe Tritec triple offset valve is supplied with a graphite adjustable gland packing which has been packed and adjusted for immediate use. However during service, leakage may occur and it may be necessary to tighten the Gland nut²⁹. This can be done with the operator on the valve. Do not overtighten the nuts however as this may cause damage to the valve and may lead to increased operating torque. If leakage persists then the Gland packings^{33,34} must be replaced and the following procedure followed:-

[Disassembly]

1. Remove the valve operator.
2. Remove the Mounting plate¹⁷.
3. Remove the Key³⁵ on the Shaft⁸.
4. Remove the Set screws anti-blowout³⁸ and slide the Anti-blowout collar³⁷ off the end of the Shaft⁸.
5. Remove the Gland plate¹⁵ and Gland plate spigot¹⁶ by undoing the Gland nuts²⁹ and sliding both parts off the end of the Shaft.
6. Extract the Gland packings^{33,34} using like a scribe. Do not reuse the Gland packings.

[Assembly]

1. Clean the gland packing hole of all dust and other foreign matters.
2. Insert a new packing set (Standard: both the braided outer rings and the plain inner rings) into the packing hole taking care when sliding the rings over the Shaft not to damage them on the keyway.
3. Replace the Gland plate¹⁵ and Gland plate spigot¹⁶ and tighten the Gland nuts²⁹ to the torque specified on the GA drawing. Do not overtighten as this will increase valve operating torques and may lead to damage to the valve.
4. Replace the Anti-blowout collar³⁷ and tighten the Set screws anti-blowout³⁸.
5. Replace the Mounting plate¹⁷ on the top of the Body¹ ensuring that the Dowel pins¹⁸ are refitted and that the Mounting plate screws²⁵ are secured to the torque specified on the GA drawing.
6. Replace the valve operator ensuring that the Dowel pins¹⁸ are refitted (if supplied) and tighten the fixings. Secure the Key³⁵ on the Shaft⁸.

Replacement of the Laminated Body Seat and/or Disc Seal

The Tomoe Tritec triple offset valve incorporates several innovative features which ensure long operating life and easy maintenance. The laminated Body seat³ and the Disc seal⁶ are readily field replaceable with no special tools meaning that both parts of sealing mechanism can be replaced without sending the valve back to the

factory. The Body seat³ and Disc seal⁶ are accurately machined on special fixtures so that they are not matched pairs and can be replaced either independently or as a pair.

Due to the triple offset geometry, the Body seat³ and Disc seal⁶ must be fitted into the valve with the correct radial alignment both relative to each other and relative the Shaft.

To facilitate this alignment, the Body seat³, Body seat retaining ring⁴, Disc seal⁶, Body¹ and Disc² all have an alignment arrow stamped on the component at 9 o'clock in the view of Disc side.

These components must be assembled with the alignment arrows in the same position. To aid initial alignment of these components and also correct alignment of the Body seat gasket⁵ and the Disc seal gasket⁷, the drillings are of an irregular spacing and can only be aligned in 1 orientation. It is essential to tighten the Body seat screws²⁴ and Disc seal screws²² to the torque detailed on the GA drawing.

[Disassembly]

1. The Disc² should be in the around 20° opened position.
2. Remove the Body seat screws²⁴.
3. Remove the Body seat retaining ring⁴, Body seat³ and Body seat gasket⁵.

If the Disc seal⁶ is to be replaced as a result of visual inspection,

- At this point, return the Disc² to the fully closed position.
- Remove Disc seal screws²² and then remove the Disc seal⁶ and the Disc seal gasket⁷.
- These works should be done in the Disc² upward position.

[Assembly]

1. Ensure that the Disc² is in a central float position by pushing the Disc² as far as possible towards the operator.
 - If the Disc seal⁶ was replaced as a result of visual inspection,
 - Ensure that the gasket sealing surface on the Disc² is clean and free from gasket debris etc.
 - Replacement of the Disc seal⁶ is the reverse of the above but it should be used the new Disc seal gasket⁷.
 - This assembly should be done in the Disc² upward position.
 - The correct radial alignment of these components is achieved using the alignment arrows.
 - Tighten the Disc seal screws²² to the torque as detailed on the GA drawing.
2. Ensure that the gasket sealing surface in the Body¹ is clean and free from gasket debris etc.
3. Replacement of the Body seat³ is the reverse of the disassembly described above, but it should be used the new Body seat gasket⁵.
4. The valve should be in the Disc² upward position and in the around 20° opened position.
5. Replace the new Body seat gasket⁵ with correct alignment. Apply a light smear of graphite grease to the topside of the Body seat³ and the underside of the Seat retaining ring⁴ and then replace these components.
6. To ensure correct positioning of the Body seat³, the Body seat screws²⁴ should be lightly tightened only, which is a load to feel a slight tension through the screw. Close the Disc² lightly and then open again.
7. Tighten the Body seat screws²⁴ to about 50% torque of specified on the GA drawing. At this stage close the Disc using the operator so that the valve is fully closed and the Disc² seal⁶ is firmly located against the Body seat³.
8. Ensure that the gap between the Disc² and the Thrust ring¹¹ is within the tolerance specified on the GA drawing.
9. Tighten the Body seat screws²⁴ to the correct torque as detailed on the GA drawing.
